Agricultural Upgrading

Increasing agricultural yields can directly reduce levels of hunger. Mass-production of agricultural products can boost incomes, and some agricultural products can be used as processed raw materials.
Agriculture is... Farmers’ Welfare and Rural Development

Agricultural development doesn’t just tackle the causes of poverty and hunger: It also provides job opportunities, and persuades people to engage in on-farm and off-farm services. This reinforces social stability, while also increasing food security and providing for people's most basic needs.
Agriculture preserves large green areas, ensuring the sustainability of ecological conservation.

Farmers should not have to rely on imported fertilizers. Dry, fallen leaves can be mixed with animal waste and allowed to decompose and ferment. This is just one method by which agricultural waste can be transformed into valuable fertilizer. We believe that agricultural production should be sustainable and function in harmony with nature.
